

EN-US

The central idea of the Space Cluster is to be an application that displays console logs of lunar missions from NASA, as soon as they are written.
At first sight, we observed that the main challenge was to establish a real-time connection between both parties, ensuring that there were no communication gaps.
Therefore, our project was based on an interface that collects data from each registered user, each in their chat and specific area of expertise, communicating in real time and sharing information such as photos, descriptive audios, among other information.

All of this based on a dynamic and self-explanatory interface.
